

ABS Data Compressing Kickoff Meeting- Real and Simulated PCC Study Results

Allen Huang

CIMSS/SSEC, University of WI-Madison

ABSTARCT

ABS will produce unprecedented volume of information rich atmospheric and environmental remote sensing data. In this part 2 presentation we are presenting the detail procedure of using PC based “ground-based” and “on-board” data compression using both real and simulated hyperspectral dataset obtained from GIFTS, AIRS and NAST-I instruments.

Outlines

- GIFTS/NAST-I/AIRS data Compression Study Results
 - DPCC Vs. Partial DPCC
 - Segmental Interferogram DPCC
 - Radiance DPCC
 - Ground Based vs. On-board
 - Hybrid DPCC
 - Noise Estimation
 - Retrieval Impacts

Current GIFTS/NAST-I/AIRS Data Compression Study Status

- Dependent Principal Component Compression (DPCC) algorithm can be used with efficient on-board compression with limited success due to restricted on-board processing resources ([GIFTS Data Compression Experiment](#))
- A similar DPCC algorithm applied to real [NAST-I ER-2 field campaign data](#) shows applicability of the approach with greater success since there has no processing limitation. It demonstrates that the DPCC not only can compress data efficiently but also reduce measurement noise.
- DPCC also applies to the [simulated AIRS orbital data](#) and reconfirm its compression validity. DPCC not only can represent information in a compression form but also can characterize noise in a quantitative way.

What is PCA?

- PCA is Principal Component Analysis, a classical approach to the problem of linear (independent) feature extraction
- PCA essentially performs Singular Value Decomposition of the Covariance Matrix
- For **Gaussianly** distributed input, PCA extracts statistically independent features

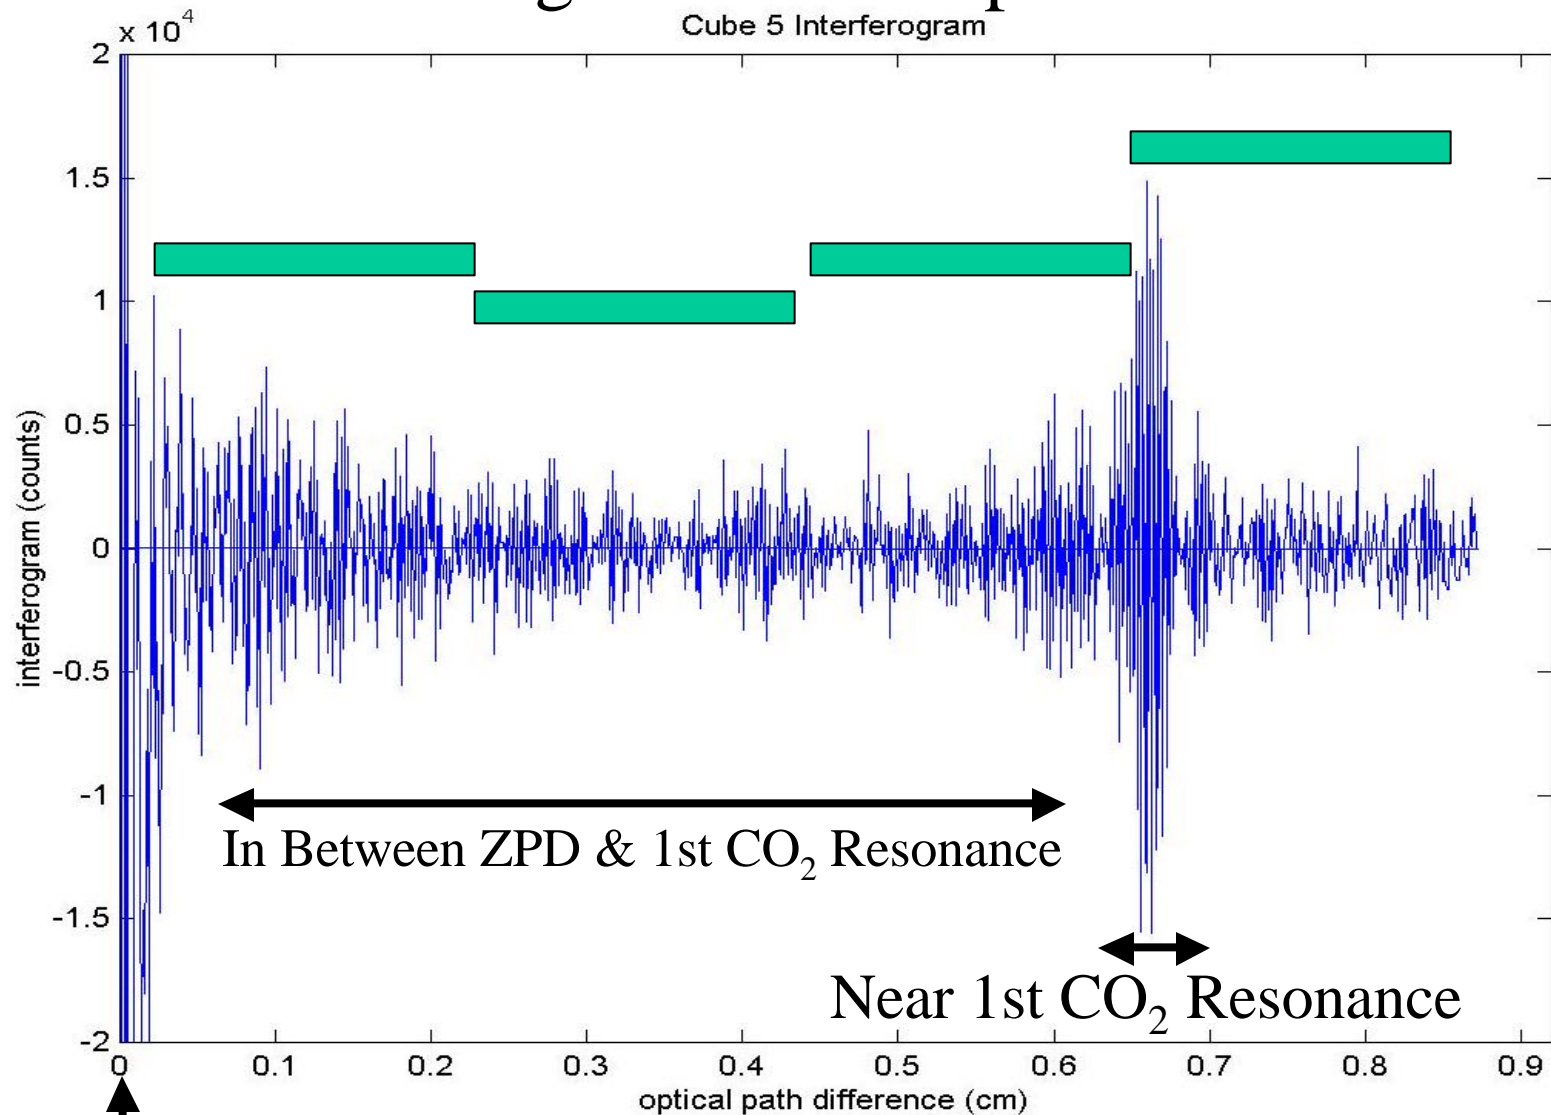

GIFTS Data Compression Experiment

(On board Only)

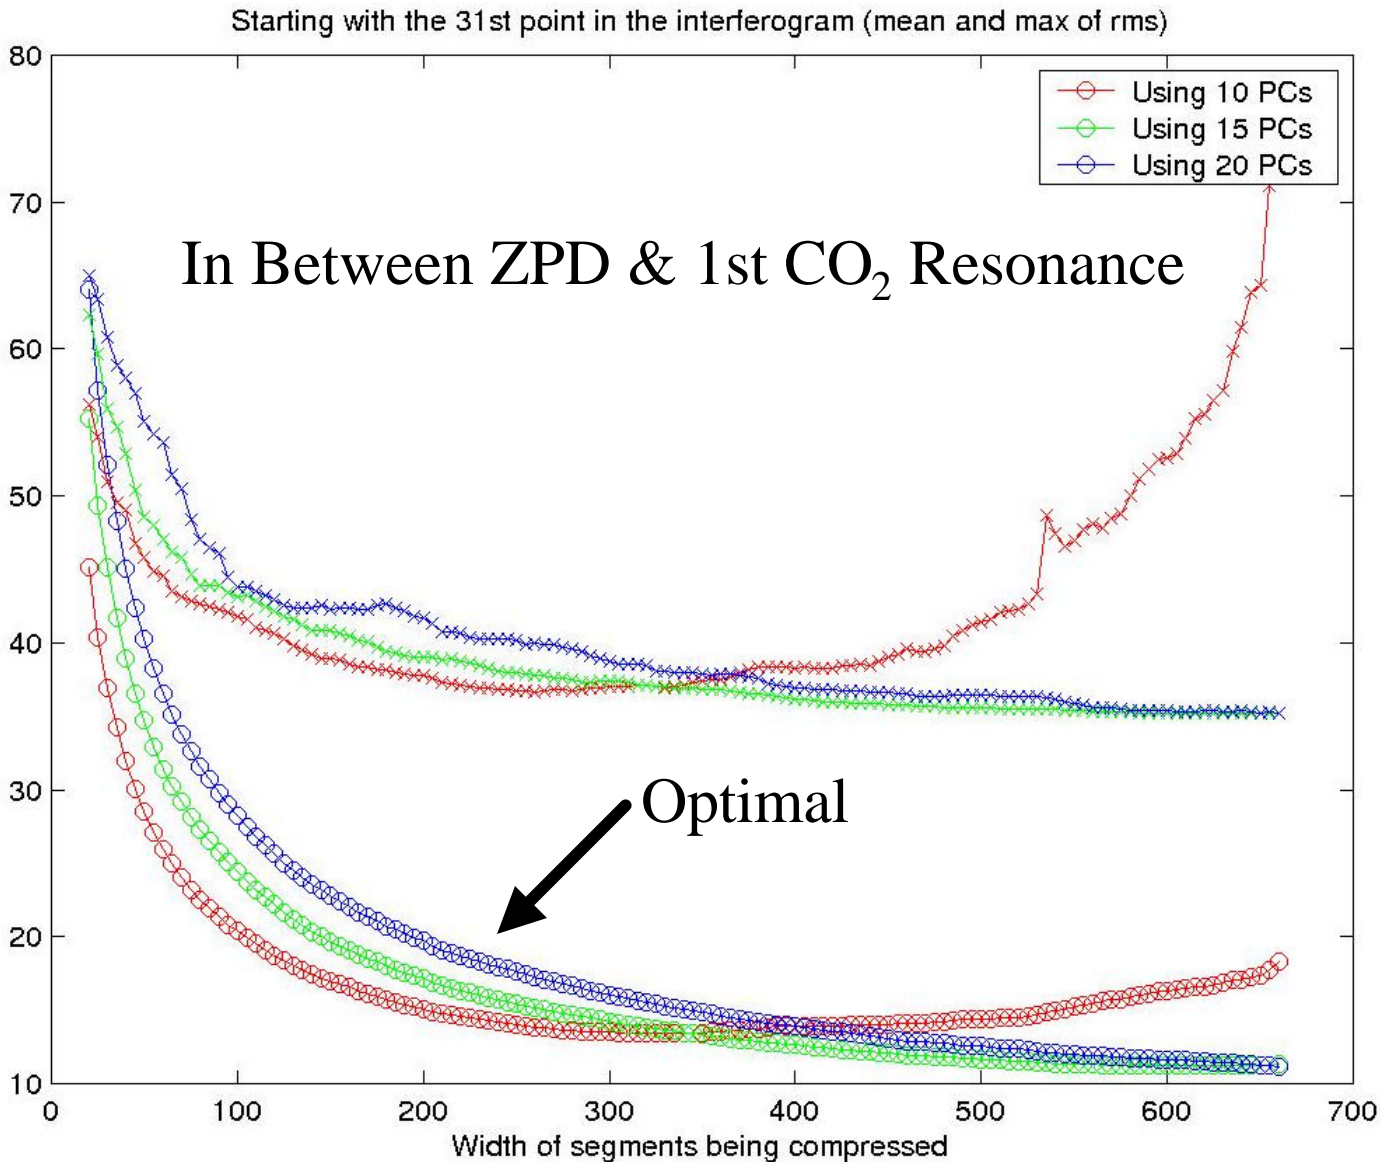

- **Compression (Uncalibrated Interferogram Segmental)**
 - Selection of the **variable length** of the segments
 - Derivation of the PCs from **selected spectra** of simulated data cube
 - **Uncalibrated IFGs compression** demonstration with limited FLOPS (for all limited aerial scene and calibration target/blackbody data)
- **Calibration**
 - Perform **calibration** of both original & compressed IFGs (using original and compressed black body, respectively)
- **Evaluation/Comparison**
 - Evaluation/Estimation of the noise components (total, correlated, uncorrelated) for the original spectra
 - Estimation/Evaluation of the noise components (total, correlated, uncorrelated) for the compressed spectra
 - Comparisons of data correlation noise before and after compression
 - Comparisons of compression residual with noise
 - Comparisons of Retrieval (Impact) with and without data compression

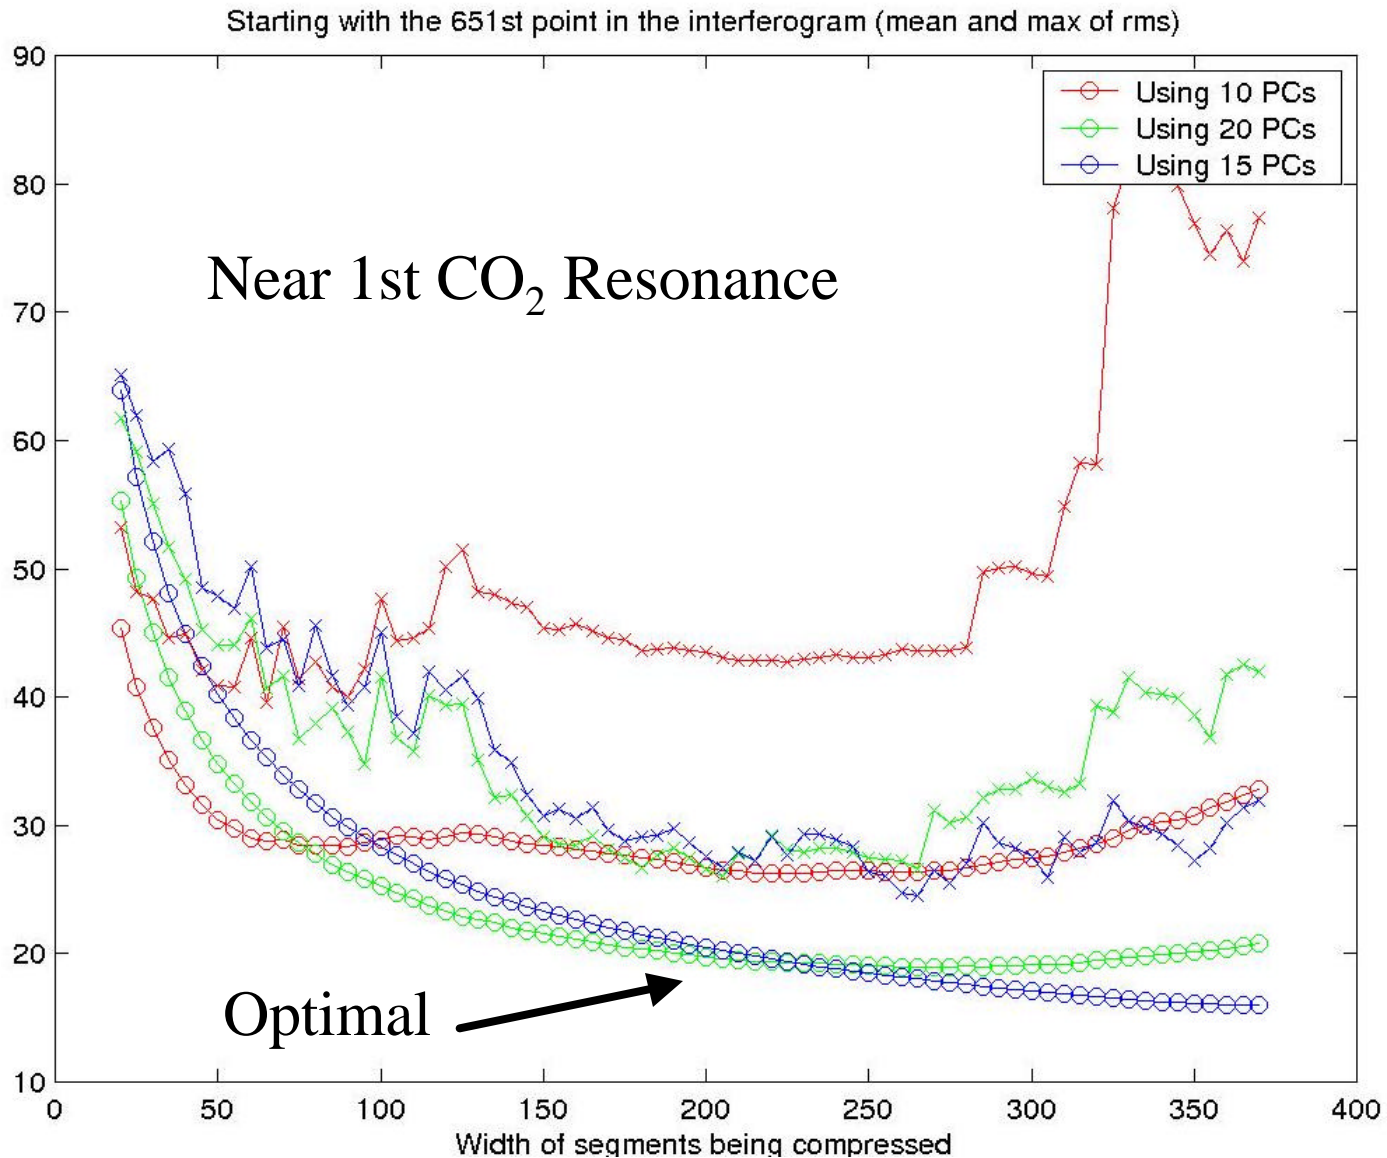

Simulated Interferogram - PC Segmented Compression

Trade of PC Segment Compression

Trade of PC Segment Compression

Definitions

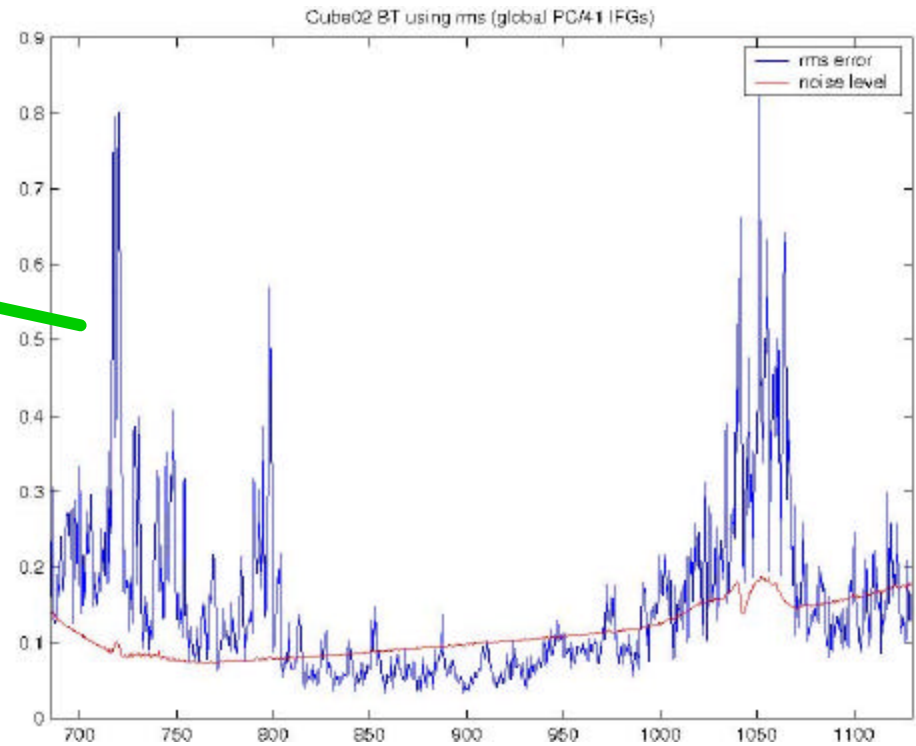

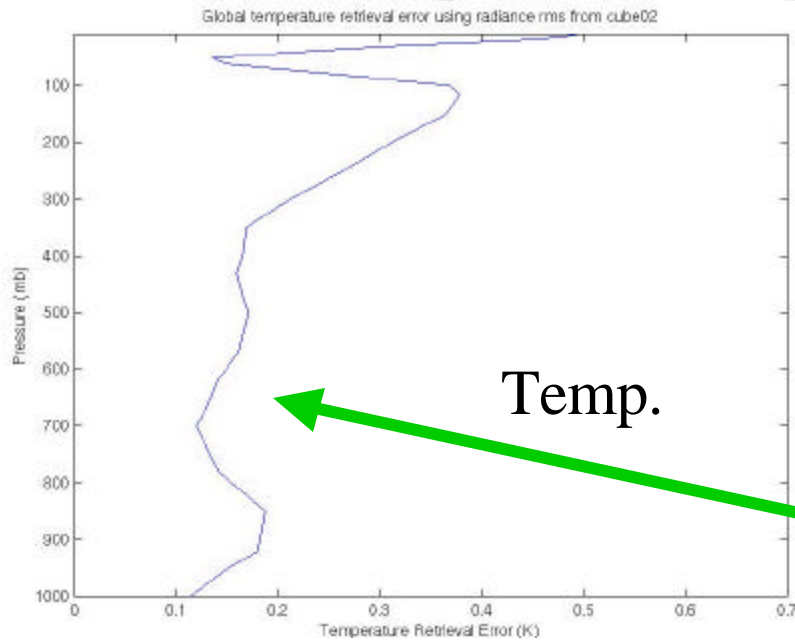

Old DPC: Old Dependent Principal Component
(fixed point segments)

New DPC: New Dependent Principal Component
(Variable point segments)

New HPC: New Hybrid Dependent & Independent Principal Component (Variable point segments and PCs are derived from on-line dependent and off-line independent historical/pre-computed data)

Note: 1. New DPC achieves better compression than old DPC
2. New HPC requires much less on-board processing than New DPC but degrades compression performance

HPC Compression Impact on Retrieval - Cube 2

AIRS Data Compression Exercise

(Ground Based Only)

- **Compression (Calibrated Spectra)**
 - Selection of domain of area (granule?) for spectral DPC derivation
 - Derivation of the PCs from all spectra of simulated data cube
- **Calibration**
 - Perform calibration of both original & compressed IFGs (using original and compressed black body, respectively)
- **Evaluation/Comparison**
 - Evaluation/Estimation of the noise components (total, correlated, uncorrelated) for the original spectra
 - Estimation/Evaluation of the noise components (total, correlated, uncorrelated) for the compressed spectra
 - Comparisons of data correlation noise before and after compression
 - Comparisons of compression residual with noise
 - Comparisons of Retrieval (Impact) with and without data compression

Hyperspectral Data Processing -

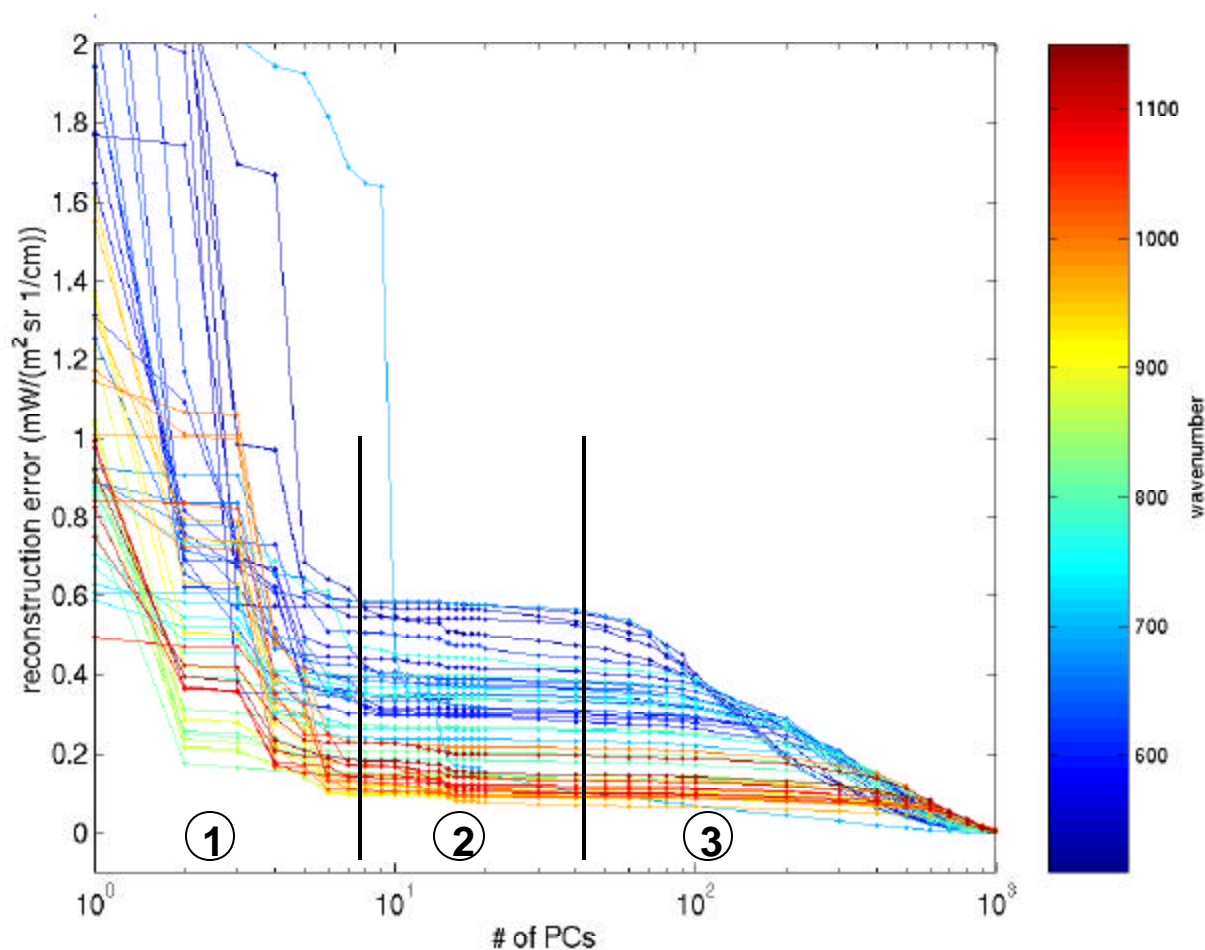

Why can we Estimate Noise Effectively ->

Signal & Noise are Estimated Separately

1 - Signal under represented

2 - Signal well represented; Noise filtered

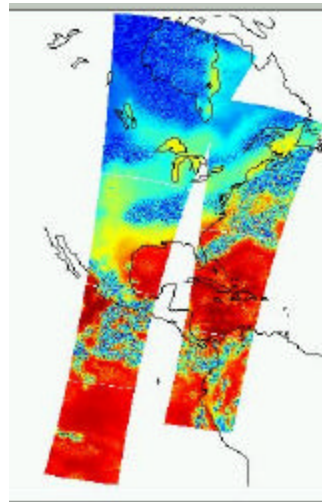

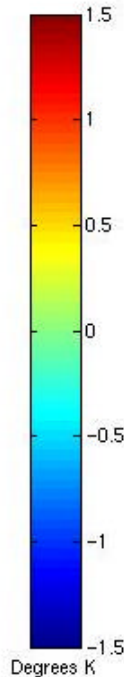

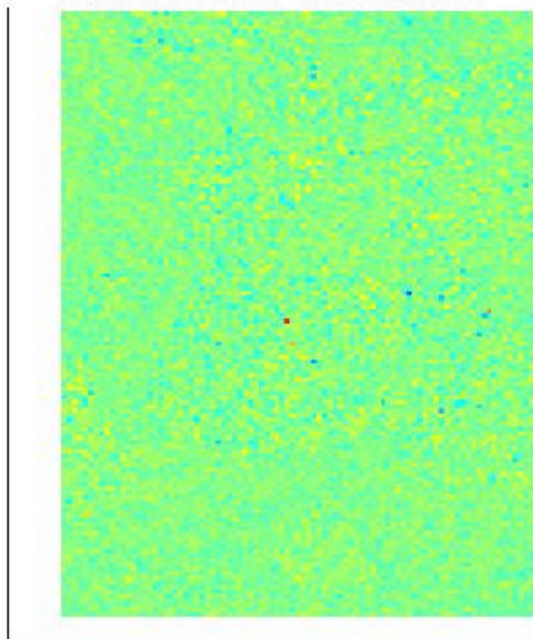

3 - Signal & noise both duplicated

Hyperspectral Data Processing - Why can we Compress Data Effectively -> **Signal Can Be Duplicated**

900 1/cm

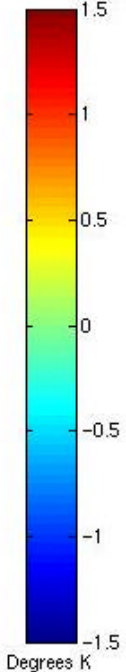

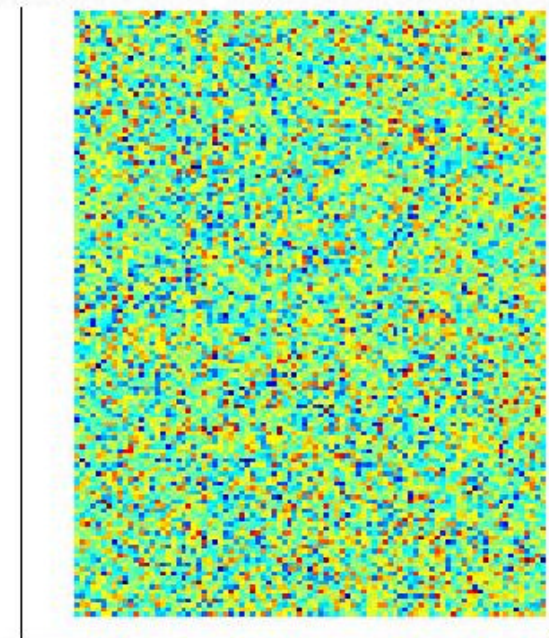

Image difference at 900 cm⁻¹ for AIRS Granule 083

Fraction of Pixels where Diff is within +/- 0.2 K	0.94337
Fraction of Pixels where Diff is within +/- 0.5 K	0.99909
Fraction of Pixels where Diff is within +/- 1.0 K	0.99992

700 1/cm

Image difference at 700 cm⁻¹ for NOAA AIRS Granule over Midwest US

Fraction of Pixels where Diff is within +/- 0.2 K	0.31259
Fraction of Pixels where Diff is within +/- 0.5 K	0.70206
Fraction of Pixels where Diff is within +/- 1.0 K	0.96387

99.9 % $< \pm 0.5$ K

20 PCs

70.2 % $< \pm 0.5$ K

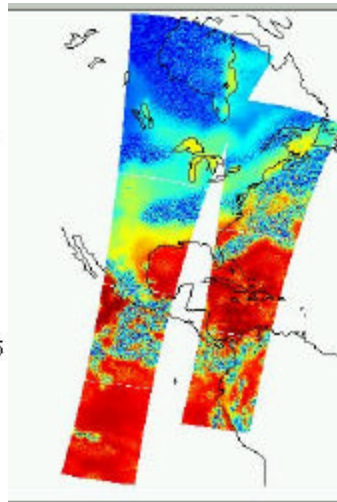

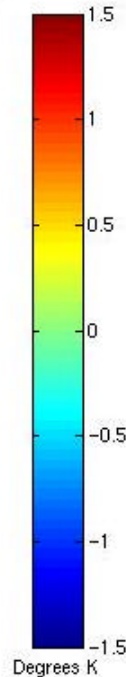

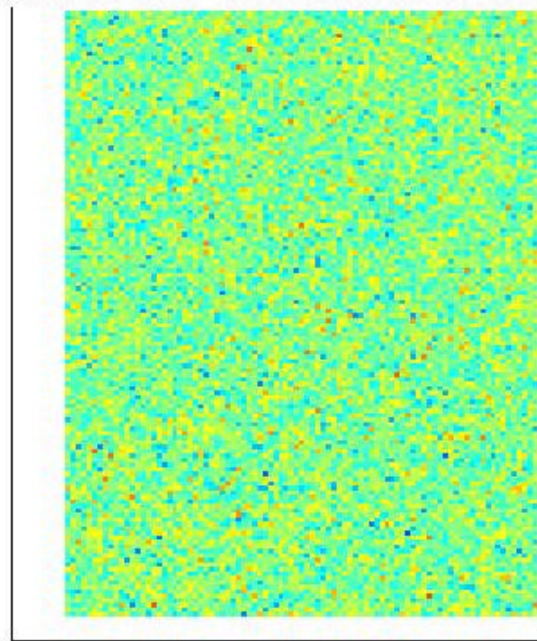

Hyperspectral Data Processing - Why can we Compress Data Effectively ->

Signal Can Be Duplicated

700 1/cm

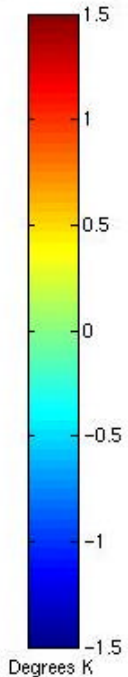

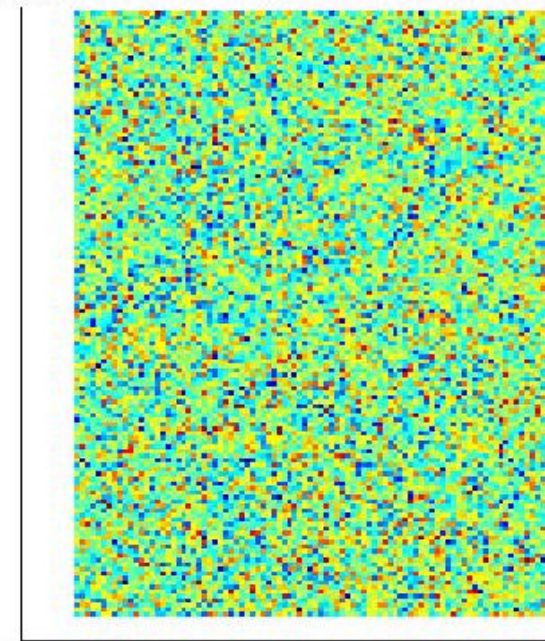

Image difference at 700 cm⁻¹ for NOAA AIRS Granule over Midwest US

Fraction of Pixels where Diff is within +/- 0.2 K	0.58477
Fraction of Pixels where Diff is within +/- 0.5 K	0.95588
Fraction of Pixels where Diff is within +/- 1.0 K	1

700 1/cm

Image difference at 700 cm⁻¹ for NOAA AIRS Granule over Midwest US

Fraction of Pixels where Diff is within +/- 0.2 K	0.31259
Fraction of Pixels where Diff is within +/- 0.5 K	0.70206
Fraction of Pixels where Diff is within +/- 1.0 K	0.96387

badFlag=0, radQual

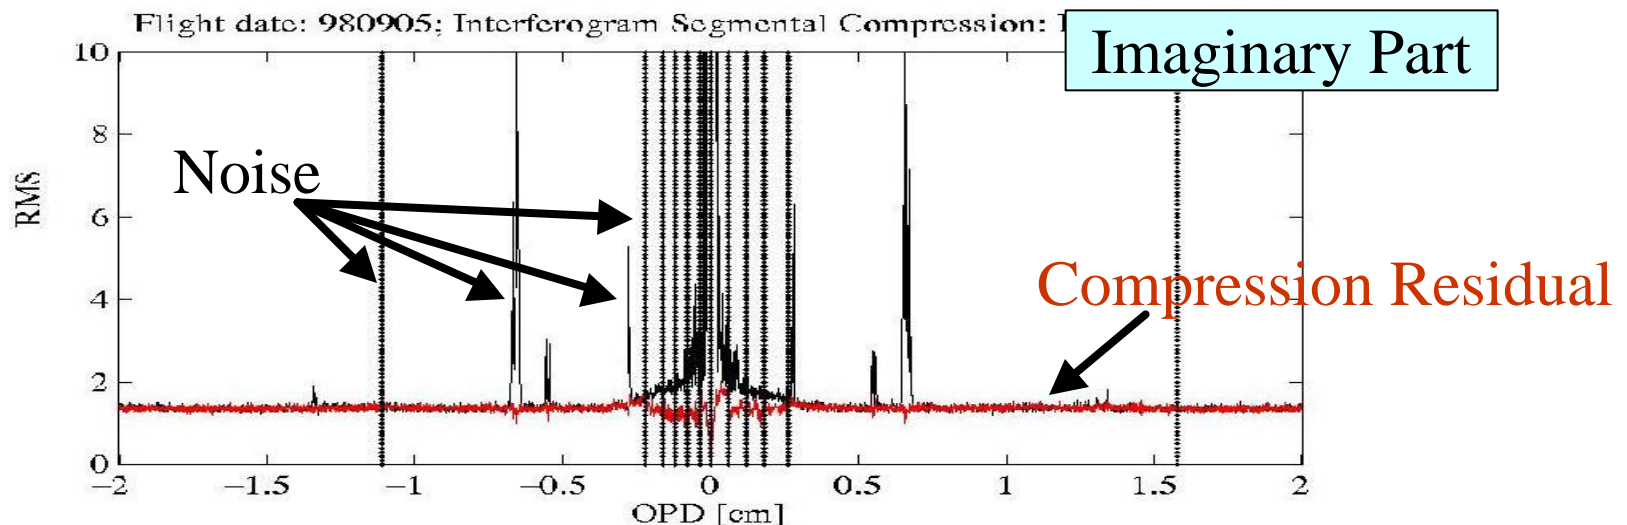

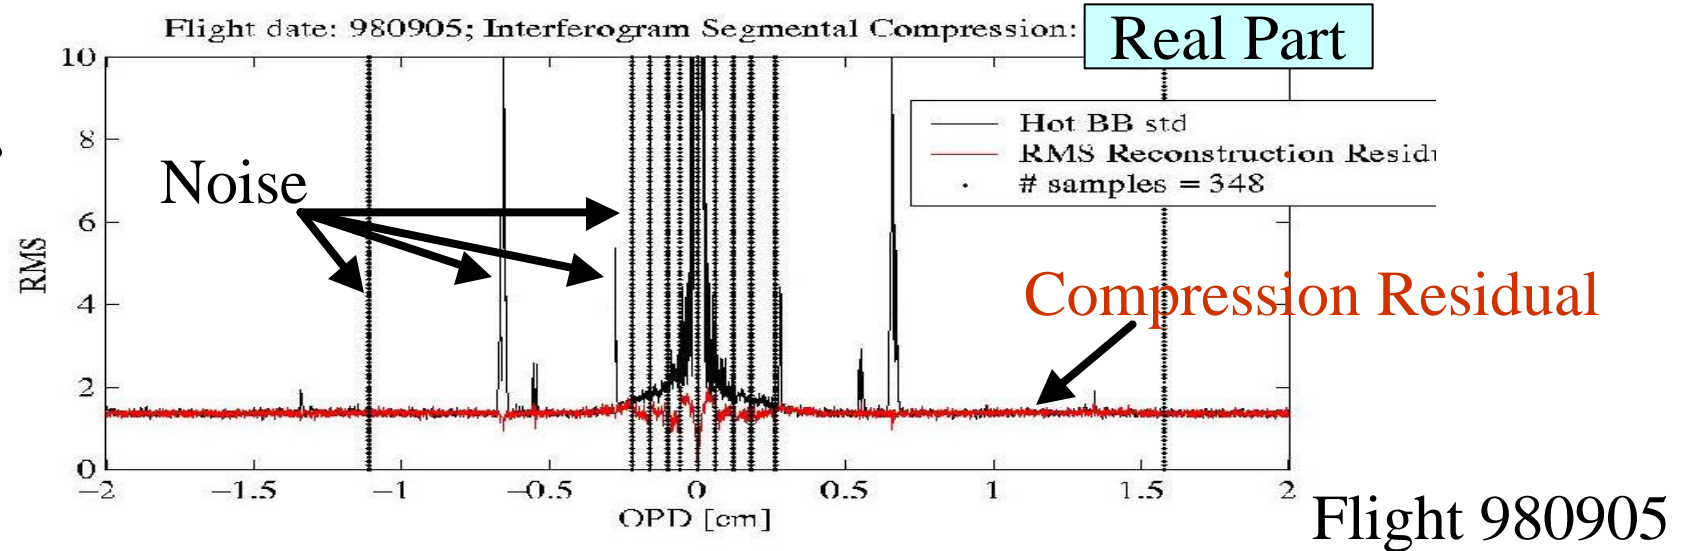

NAST-I Data Compression Procedure

- **Compression (Uncalibrated Interferogram Segmental)**
 - Selection of the length of the segments (11)
 - Derivation of the PCs from three NAST-I flights
 - Uncalibrated IFGs compression demonstration of a single flight (both real and imaginary parts, earth & black body views)
- **Calibration (uncompressed and compressed)**
 - Perform calibration of both original & compressed IFGs (using original and compressed black body, respectively)
- **Evaluation/Comparison**
 - Evaluation of the noise components (total, correlated, uncorrelated) for the original spectra
 - Evaluation of the noise components (total, correlated, uncorrelated) for the compressed spectra
 - Comparisons of noise before and after compression
 - Comparisons of compression residual with noise
